Personal details

Birthday/-place 19 September 1996 in, *Madrid, Spain*
Citizenship Spanish

Research Interests

Macroeconomics, Labor Economics, Inequality, Family Economics

Education

2021 – Present (October)
Doctor of Philosophy in Economics,
Goethe University Frankfurt, Germany

2019 – 2020 (September – July)
Master of Science in Economics,
Universidad Carlos III de Madrid (UC3M)

2014 – 2018 (September – July)
Bachelor in Economics and Finance,
Universidad Autónoma de Madrid (UAM)

Employment

2023 – Present (August)
Goethe University Frankfurt,
Research Assistant - Chair of International Trade, Development and Growth
Supervisor: Prof. Georg Duernecker, Ph.D.

2020 – 2025 (December – December)
Deutsche Bundesbank,
Research Assistant - Research Centre

2018 – 2019 (September – September)
Santander Securities Services (S3),
Finance Intern - Control Finance Department

Work in progress

Marketization of Home Production and Female Labor Supply,
This paper investigates the macroeconomic and distributional effects of a 50% *reduction of taxes on market substitutes for home production. Using a multi-sector, overlapping generations collective household model calibrated to Germany, I incorporate dynamic human capital accumulation and intra-household bargaining. The results demonstrate that the reform expands market service output by 49 percent. Driven by women's comparative advantage in services, the marketization of domestic work increases aggregate female market hours by 16.6 percent, narrowing the gender hours gap by 15 percent. Crucially, these labor supply gains compound over the life cycle, mitigating traditional household specialization.*

Disconnect: How Separation from Others and Self Manifests in Economic and Social Outcomes, *with Sandra Eickmeier*,
This paper examines how social disconnection and consciousness—defined as a deeper awareness of oneself and reality—relate to economic behavior, political attitudes, health outcomes, and cultural engagement. Using panel data from households in the Netherlands, we show that social isolation is associated with lower consumption, poorer health, reduced institutional and interpersonal trust, a higher likelihood of supporting right-wing extremist parties, and reduced cultural engagement. We argue that social disconnection is only one facet of a deeper underlying issue: a disconnect from individuals' existential inner dimensions or core self. Building on this perspective, we introduce a novel classification of consciousness based on traditional, modern-rational, modern-hedonic, and integral value orientations. Extending the empirical analysis, we find that individuals with a modern–hedonic orientation tend to exhibit higher levels of consumption, lower institutional trust, a greater propensity to support far-right political parties, and less consistent well-being than traditional individuals, whereas individuals at an integral consciousness level display more favorable outcomes across domains. Taken together, these results suggest that both social disconnection and consciousness operate as systemic phenomena; addressing contemporary societal challenges may therefore require targeting these underlying dimensions.

Technical skills

Software Matlab, Stata, R (Intermediate), Python (Basic), MS Office, LaTeX

Miscellaneous

Languages Spanish (native), English (C2), German (B2.2)
